What Is Methadone?

'**Methadone**' is a medicine used to treat [Opioid Use Disorder](#) (OUD). It is a prescription medication used primarily to treat **opioid addiction** and to manage **chronic pain**. It helps relieve withdrawal symptoms and cravings in people who are addicted to opioids, such as heroin or prescription painkillers, without causing the "high" associated with those drugs.

Methadone is a long-acting full opioid agonist, and a schedule II controlled medication that is used to treat people with a confirmed diagnosis of opioid use disorder (OUD), and also for pain management.

When used for **pain management**, methadone provides long-lasting relief and is typically reserved for the treatment of severe pain that other pain relievers cannot manage.

However, methadone carries the risk of **dependence**, **tolerance**, and **overdose** if not used properly.

If you are suffering from opioid use disorder? Then you should buy methadone online from [Pills Anxiety](#) and get UP TO 25% discount on all the medicines.

"Saving on drug, Saving on time"

Who Should Use Methadone?

'**Methadone**' is used in the treatment of OUD, and in the treatment of pain management.

This medication helps to achieve, sustain, and people can reclaim active and meaningful lives from this medication.

Patients who are taking Methadone for the [treatment of \(OUD\)](#) opioid use disorder should receive the medication under the supervision of the practitioner.

'**Methadone**' is one component used for the part of comprehensive treatment plan, it includes counselling and other behavioural health problem **therapies** to provide patients with a whole-person approach.

Some methadone tablets are meant to be swallowed at once, while others are meant to be dissolved first in liquid. Methadone is available in both as a **ready-to-drink solution**, and as a concentrate form, which must be mixed with water or fruit juice and then consumed.

Methadone is also available in a liquid form that is injected into the body **via injection**.

When used in the treatment of narcotic addiction, Methadone suppresses withdrawal symptoms for **24 to 36 hours**.

An individual should not share their medication with others, The time of taking Methadone varies from person to person according to their condition.

'Methadone' is safe and effective when it is used according to the prescription.

It can cause various severe **unwanted health issues** if used by a person who is not used to opioid medicines, may it be a person, **children, or pets**; otherwise, it can prove to be harmful to their health.

Do not chew, crush, or swallow the tablets, you can break them into half and then swallow them one by one.

Dosing Information

The dose is prescribed according to the strength of the medicine for different people according to their health. The dose should not exceed the specified amount.

For Opioid Use Disorder –

For adults – [methadone 10mg](#) – 30 mg tablets should be taken once daily. Your doctor may later adjust your dose according to your response. Those doses may not usually exceed **40 mg** in a day.

For Children – This medication should not be used for children without taking a doctor's prescription. Do not change the dose, stick to your prescription chart unless your doctor tells you to do so. Keep an average gap between the doses so that you don't overdose it.

Always check the back of the tablet for the **expiry date**. Do not throw your medicines here and there, remember to flush them in the toilet so that they cannot be misused by anyone.

Methadone Side-Effects

Other medicines may [interact with Methadone](#) and can cause serious **heart problems**. Even after the effects of Methadone treatment or wear off, some **active ingredients** remain in the body for some time, which can interact with other medicines.

Unintentional overdose can be possible if an individual does not take this medication as prescribed by their doctor or while using it without any prescription.

Some common symptoms of side effects caused by Methadone are –

- Headache
- Weight gain
- Stomach pain

- Dry mouth
- Sore tongue
- Flushing
- Mood changes
- Vision problems
- Sweating
- Mood swings
- Confusion

Take instant medical help if you experience any of the signs of these severe side effects and the interaction of Methadone with opioids or other medicines –

- Experiencing difficulty in breathing process
- Feeling lightheaded or feel like fainting
- Experience hives or rashes
- Swelling on the face, on lips, tongue, or throat
- Experiencing Chest pain
- Experience a fast or pounding heartbeat
- Experience hallucinations or confusion

Pregnant women and feeding mothers can safely use Methadone because its use does not cause any harm to the child. During pregnancy undergoing Methadone management treatment does not cause birth defects.

Methadone has the ability to **prevent withdrawal symptoms** and it helps pregnant women to better manage their Opioid Use Disorder (**OUD**) while avoiding many health risks to both mother and baby.

Pregnant women who experience withdrawal symptoms can be at risk or can experience **miscarriage** or **premature birth** of the baby, as withdrawal can cause uterus contraction.

It is possible that babies may experience withdrawal symptoms after birth, which is also known as neonatal abstinence syndrome (**NAS**). These withdrawal symptoms may begin within minutes or can take up to hours after birth, with most symptoms appearing within 72 hours.

What To Avoid While Using Methadone?

- Do not consume alcohol while taking Methadone.
- Do not drive or use any machinery when taking these medications.
- Please do not continue to take other medicines while taking Methadone, as it can interact and can cause withdrawals.
- If you begin **methadone maintenance**, you must avoid taking other opioids such as **heroin**, codeine, morphine, or opium. Otherwise, these combinations can prove to be fatal to your health.

Changing your prescribed dosage on your own can lead to some severe side effects that can harm your health conditions. Remember to use these medications according to what your doctor has prescribed to you.

Final Words

Methadone medication should be used by taking a proper prescription by a doctor or by any healthcare professional. Using it without prescription can cause various health problems, and you may have to experience certain serious to non-serious side effects.

You can use Methadone for pain management, and also to overcome the addiction of heroin.

Pregnant and feeding mothers can safely use this medication during or after the pregnancy but only when it is prescribed by the doctor.

If you are going to start methadone maintenance to treat opioid use disorder? Then you must buy Methadone Online from Pills Anxiety instantly.
